

Anticipated Team Impact

RELEASE SUPPORT AND SUSTAINMENT

How Clarity changes visibility, context, routing, and decision support without replacing current servicing workflows

Clarity sits between servicing data and accountable action

Clarity reads approved servicing context from existing systems, assembles the relevant information, and presents guidance, routing intelligence, and next-step context inside the workflows teams already use.

Systems of Record

- Loan system
- Servicing data
- Notices and documents
- Historical questions, escalations, and outcomes

Clarity Intelligence Layer

- Data ingestion
- Context assembly
- Ask Clarity
- Notice Insights
- Clarity Copilot
- Suggested routing
- Source-linked guidance
- Human-confirmed mock workflow actions

Outcomes and Workflows

- Borrower clarity
- Servicing resolution
- Floor-support review
- Product review
- Technical escalation
- Leadership visibility

Clarity overlays existing workflows. It does not replace the loan system, servicing platform, support queue, accountable team, or approval process.

The change is in visibility, context, and routing—not in servicing authority

What Changes with Clarity

→ Visibility

Issues surface earlier, before they escalate.

→ Context

Loan, notice, borrower, queue, confidence, owner, and history in one view.

→ Categorization

Clarity suggests a category, queue, and rationale for human validation.

→ Routing

The responsible user confirms or corrects the suggested destination.

→ Escalation Timing

Material issues become visible before they're buried in case volume.

→ Ownership Clarity

Each routed issue shows a named owner, status, and next step.

What Does Not Change

- Servicing teams remain responsible for validation and resolution
- Existing queues remain the destinations for operational work
- Human users approve material workflow actions
- Loan records remain unchanged
- Payment records remain unchanged
- Official notices remain unchanged
- Clarity does not make servicing determinations
- Clarity does not autonomously route or resolve ambiguous cases

"Clarity does not create a parallel operating model. It strengthens the current model by presenting the right context to the right person earlier."

Each Team Receives a Different View of the Same Operational Truth

Five teams interact with Clarity through distinct lenses. The underlying data is shared; the responsibilities and risks are not.

01

Borrower Experience

Changes: Plain-language payment-change guidance, notice explanation, source-linked Ask Clarity answers, visible human-help path

Unchanged: Loan terms, payment records, official notice language, servicing decisions

Risk: Clarity becomes another place to search instead of simplifying the experience

02

Servicing Agents

Changes: Consolidated case context, suggested categorization, queue recommendation, confidence, owner, source records

Unchanged: Servicing judgment, borrower support, case resolution

Risk: Over-reliance on suggested classifications

03

Floor Support & Operations

Changes: Cleaner triage, routing review, correction capability, visibility into repeated process friction

Unchanged: Queue management, support-flow execution, operational ownership

Risk: A misroute delays resolution or hides the actual issue type

04

Leadership & Stakeholders

Changes: Visibility into open, routed, escalated, and repeated issues; launch health and routing confidence

Unchanged: Risk acceptance, launch oversight, material decision authority

Risk: Activity is visible without enough context for a decision

05

Product & Delivery

Changes: Support signals arrive as structured evidence connected to users, notices, cases, and routing outcomes

Unchanged: Product owns prioritization, delivery coordinates rollout, engineering owns technical resolution

Risk: Operational noise enters the backlog without validation

For Borrowers, Clarity Must Reduce Uncertainty — Not Create Another Destination

Borrower Journey

01

A servicing event occurs

02

Clarity shows what changed

03

Clarity explains why it changed

04

Clarity displays the effective date and next step

05

The borrower asks a grounded question

06

The borrower understands or requests human support

07

The existing servicing workflow continues

Clarity May

- Display loan and notice information
- Explain a payment change
- Define servicing terminology
- Show source references
- Display a next step
- Preserve context during the mock escalation flow
- Direct the borrower to human support

Clarity May Not

- Change the loan, payment, or escrow
- Alter a notice or make a servicing decision
- Approve a payment plan or waive a fee
- Give legal or personalized financial advice
- Resolve an ambiguous account issue without human review

Primary success measure: The borrower understands what changed, why it changed, and where to get help without reconstructing the answer across multiple surfaces.

For Servicing Teams, Clarity Reduces Context Reconstruction

The servicing workflow does not change. The information available at the start of the workflow improves.

Before Clarity	With Clarity
Search multiple systems	Open one consolidated case view
Review notices and case notes separately	Review source-linked context
Determine issue type manually	Validate the suggested category
Identify the responsible queue	Review current and suggested queue
Reconstruct previous activity	See owner, status, confidence, and SLA risk
Decide whether escalation is required	Confirm or correct routing
Repeat context during handoff	Preserve notes and history in the mock workflow

"The servicing workflow does not change. The information available at the start of the workflow improves."

Conceptual interface and fictional demonstration data. No production banking systems are connected.

"Clarity assists classification and handoff. The servicing or floor-support user remains responsible for validation and correction."

Misrouting must be visible, correctable, and traceable

Five-Step Correction Model

01

Review Suggestion

Compare the current category and queue with Clarity's recommendation

02

Select the Correct Destination

Choose from: Floor Support · Customer Support
· Product Review · Technical Escalation

03

Add a Correction Note

Document why the original suggestion was changed

04

Confirm the Mock Reroute

The prototype updates local mock state only

05

Preserve the Correction

Retain the original suggestion, corrected destination, user, timestamp, and note in mock history

 **Hypercare signal:** Elevated reroute volume indicates a categorization, guidance, or training gap that requires review.

Conceptual interface and fictional demonstration data. No production banking systems are connected.

Clarity Copilot helps internal teams retrieve status and prepare governed actions

Clarity Copilot is a role-aware conversational interface to information available inside the Clarity experience. It is not a freeform enterprise chatbot.

Sample Interaction (*Conceptual*)

User: "Where is case CL-1047 and what needs attention?"

Clarity Copilot:

- **Status:** Routing review
- **Current queue:** Customer Support
- **Suggested queue:** Floor Support
- **Owner:** Jordan Lee
- **Routing confidence:** 91%
- **SLA risk:** Low
- **Recommended next step:** Review and confirm routing

Every Answer Includes

- Direct response · Current status · Category · Owner · Queue
- Source records · Timestamps · Confidence or uncertainty
- Recommended next step

Where Approved, Copilot May Prepare

- Routing confirmation · Routing correction · Note
- Follow-up request · Escalation · Status update
- Product-review item · Technical escalation

Guardrails

- Role-aware · Source-linked · Human-confirmed
- No autonomous resolution · Local mock state only
- Visible completion state

Conceptual interface and fictional demonstration data. No production banking systems are connected.

Every issue must have a category, destination, owner, and next step

Four routing destinations. One high-severity exception. No issue remains unassigned.

Destination	Typical Issue	Accountable Owner	Escalate When
Customer Support	Borrower cannot understand a displayed field, notice, or payment-change explanation	Support Lead	Issue cannot be resolved from approved servicing information
Floor Support	Agent or support team needs process guidance, triage correction, or operational clarification	Operations or Floor-Support Owner	Process is missing, contradictory, or repeatedly misunderstood
Product Review	Clarity lacks required context, repeated confusion appears, or a workflow gap affects multiple users	Product Manager	Issue requires prioritization, design change, or backlog review
Technical Escalation	Incorrect data, broken route, unavailable interface, integration failure, or technical defect	Engineering or Implementation Support	Functionality unavailable, data integrity at risk, or multiple users affected

⊗ **High-severity exception:** Potential customer harm, security risk, data exposure, or critical servicing interruption is immediately surfaced to the launch owner and designated leadership.

No issue remains unassigned. Every routed issue must have a destination, owner, status, next step, and review point.

Shared visibility does not mean shared accountability

Every issue has one accountable owner, even when several teams contribute.

Product

- Owns product-gap evaluation
- Owns backlog prioritization
- Owns release hypotheses
- Reviews recurring patterns

Operations

- Owns support-flow execution
- Owns queue health
- Owns routing correction process
- Owns operational handoffs

Support

- Owns day-to-day borrower issue handling
- Validates initial case information
- Completes approved support actions

Floor Support

- Assists servicing agents
- Reviews categorization
- Corrects misroutes
- Identifies process and training gaps

Engineering

- Owns defect diagnosis and technical fixes
- Documents technical disposition
- Supports integration and data validation

Leadership & Launch Owner

- Owns launch oversight
- Owns high-severity intervention
- Removes cross-functional blockers
- Approves hypercare exit

"Shared visibility does not mean shared accountability. Each issue has one accountable owner."

Hypercare provides temporary control while the operating pattern stabilizes

A limited post-release period with heightened monitoring, faster review, and explicit cross-functional coordination.

What to Monitor

Volume and Type

- Ticket volume · Issue category · User type · Severity · Source channel

Routing

- Initial routing accuracy · Reroute volume · Unassigned issues · Time to named owner

Experience

- Repeated borrower confusion · Ask Clarity fallback rate · Copilot insufficient-evidence responses · Escalation volume

Technical Health

- Open critical defects · Error states · Data-display issues · Broken routes

Hypercare Actions

- Review issue patterns
- Correct routing
- Escalate material issues
- Prioritize defects
- Update guidance
- Clarify ownership
- Capture release learnings
- Communicate launch health

Review Cadence

Set by the launch owner based on release risk and pilot volume.

Hypercare Exit

Hypercare ends only when all exit criteria are met and the launch owner, operations owner, product owner, and leadership sponsor agree.

Hypercare ends when support becomes stable, explainable, and governable

Required Exit Criteria

- ☐ No critical launch blockers remain open
- ☐ Routing behavior is stable and reroutes are understood
- ☐ Support teams understand issue categories
- ☐ Named owners are consistently assigned
- ☐ Escalation paths are functioning
- ☐ Leadership can interpret launch-health reporting
- ☐ Product has reviewed recurring gaps
- ☐ Engineering has documented the status of open defects
- ☐ Standard support can continue without loss of visibility or operational control

Thresholds must be established before release after baseline and pilot-volume review.

Measurement Categories

Health Domain	Measurement Categories
Routing Health	Correct initial routing · Reroute rate · Time to named owner
Support Health	Ticket volume by category · Time to first response · Open issue age · Repeated issue rate
Product Health	Recurring product gaps · Validated backlog candidates · Borrower confusion themes · Ask Clarity and Copilot answer quality
Technical Health	Defect volume · Severity · Time to disposition · Data-display accuracy
Governance Health	Unassigned issue count · Overdue decisions · High-severity escalation time · Audit completeness

Five principles for a disciplined Clarity release

Keep the first release simple

Start with one focused servicing workflow, limited issue categories, and the four approved routing destinations.

Route first, optimize later

Reliable ownership and handoff matter more than advanced classification.

Do not automate ambiguity

When confidence, category, or required decision is unclear, require human review.

Preserve human accountability

Clarity may explain, summarize, classify, and prepare actions. Accountable people approve material actions.

Convert support signals into product learning

Repeated issues should result in improved guidance, process changes, product hypotheses, or backlog review.

Clarity is successful when the existing process becomes easier to manage

"Clarity is successful when teams do not need to adopt a parallel process. The existing process becomes easier to understand, manage, and improve."

Borrowers

One surface for payment-change understanding, source-linked answers, and human support.

Servicing Agents

Context arrives with the case. Validation replaces reconstruction.

Floor Support & Operations

Misroutes are visible and correctable. Recurring process friction appears earlier.

Leadership

Launch health, routing patterns, and escalations arrive with context and ownership.

Product & Delivery

Support signals become structured product evidence before entering the backlog.

Surface the issue → assemble the context → confirm the owner → complete the existing workflow → learn from the outcome

Launch Simply, Preserve Judgment, and Learn From Every Issue

- Keep the first release narrow
- Use only approved routing destinations
- Keep systems of record read-only
- Require confirmation for workflow actions
- Route ambiguity to people
- Preserve ownership and auditability
- Convert repeated issues into product learning

"Every issue has a destination. Every destination has an owner. Every owner has a next step."
